BackgroundTraditional methods to estimate power/energy usage of the processor has always been a cumbersome task that included special purpose tools or instrumentation on the platform along with third party equipment.. The API layer is a set of libraries and dlls that can be called and offers the flexibility to build the tool within code sections of an application.. The motivation for the tool was to assist end-users, ISV's, OEM's, developers, and others interested in a more precise estimation of power from a software level without any H/W instrumentation.
